

Null decomposition (too small to draw to scale): $+2 \cdot \text{Cov}(E,D) = -0.0042$, $+\text{Var}(D) = +0.0213$.

Var(E) is identical for null and observation — margins are shared exactly. Var(D) is 29× the null, but a strongly negative 2·Cov(E,D) pulls the observed total below the null: both are true at once.

Figure computed from results/arc_reconcile.json (src/reconcile.py); no manual numbers.
